The Python Package Index (PyPI) is a repository of software for the Python programming language.

PyPI helps you find and install software developed and shared by the Python community. [Learn about installing packages](#) .

Package authors use PyPI to distribute their software. [Learn how to package your Python code for PyPI](#) .

**pip 21.3.1**

`pip install pip`

[Latest version](#)

Released: Oct 22, 2021

The PyPA recommended tool for installing Python packages.

## Project description

`pypi` `v21.3.1` `docs` `passing`

pip is the [package installer](#) for Python. You can use pip to install packages from the [Python Package Index](#) and other indexes.

Please take a look at our documentation for how to install and use pip:

- [Installation](#)
- [Usage](#)

We release updates regularly, with a new version every 3 months. Find more details in our documentation:

- [Release notes](#)
- [Release process](#)

In pip 20.3, we've [made a big improvement to the heart of pip](#); [learn more](#). We want your input, so [sign up for our user experience research studies](#) to help us do it right.

## MyQR 2.3.1

`pip install MyQR` 

 [Latest version](#)

Released: Sep 25, 2016

Generator for amazing QR Codes. Including Common, Artistic and Animated QR Codes.

### Project description

Home Page: <https://github.com/sylnsfar/qrcode>

Overview  
=====

It can generate common qr-code, artistic qr-code (black & white or colorized), animated qr-code (black & white or colorized).

# Packages

<https://villa.jianzhang.tech/>

# Packages

```
from MyQR import myqr
```

```
"""Generate a QR code"""
```

```
myqr.run(words='https://villa.jianzhang.tech/',  
         save_name='001.png',  
         )
```

```
"""Generate a QR code with a background picture"""
```

```
myqr.run(words='https://villa.jianzhang.tech/',  
         picture=r'duola.jpg',  
         colored=True, # True: Color, False: Gray  
         save_name='002.png')
```

# Functions

```
def my_function():  
    print("Hello from a function")
```

```
my_function()
```

```
def my_function(fname):  
    print(fname + " Refsnes")
```

```
my_function("Emil")  
my_function("Tobias")  
my_function("Linus")
```

# Functions

```
def add(a,b):  
    return a+b
```

```
def lessthan(a,b):  
    return a<=b
```

```
print(add(5,4))  
print(lessthan(5,4))
```

# Comparison Operators

# <	strictly less than
# <=	less than or equal
# >	strictly greater than
# >=	greater than or equal
# ==	equal
# !=	not equal

# Conditional Statements

```
temperature = 25
```

```
if temperature > 30:
```

```
    print("It's warm")
```

```
    print("Drink water")
```

```
elif temperature > 20:
```

```
    print("It's nice")
```

```
else:
```

```
    print("It's cold")
```

```
print("Done")
```

# Ternary Operator

```
age1 = 17
```

```
if age1 >= 18:
```

```
    print("Eligible")
```

```
else:
```

```
    print("Not eligible")
```

```
age2 = 20
```

```
message = "Eligible" if age2 >= 18 else "Not eligible"
```

```
print(message)
```

# Logical Operators

```
income = 2000
good_credit = True

if income > 2500:
    high_income = True
    print("You have a high income!")
else:
    high_income = False
    print("You have a low income")
if high_income and good_credit:
    print("Eligible for loan")
else:
    print("Not eligible for loan")
```

# Logical Operators

```
income = 2000
good_credit = True

if income > 2500:
    high_income = True
    print("You have a high income!")
else:
    high_income = False
    print("You have a low income")
if high_income or good_credit:
    print("Eligible for loan")
else:
    print("Not eligible for loan")
```

# Logical Operators

```
age = 22
```

```
if age >= 18 and age < 65:  
    print("Eligible")
```

```
if 18 <= age < 65:  
    print("Eligible")
```

# For Loops

```
for number in range(3):  
    print("Attempt", number + 1, (number + 1) * ".")
```

```
for number in range(1, 4):  
    print("Attempt", number, number * ".")
```

```
for number in range(1, 10, 2):  
    print("Attempt", number, number * ".")
```

# For Loops

```
successful = False

for number in range(3):
    print("Attempt")
    if successful:
        print("Successful")
        break
else:
    print("Attempted 3 times and failed")
```

# For Loops

```
for x in "Python":  
    print(x)
```

```
for x in [1, 2, 3, 4]:  
    print(x)
```

# Nested Loops

```
for x in range(2):  
    for y in range(3):  
        print(f"({x},{y})")
```

# While Loops

```
number = 100
while number > 0:
    print(number)
    number = number // 2
```

```
command = ""
while command.lower() != "quit":
    command = input(">")
    print("Echo", command)
```

# While Loops

```
while True:  
    command = input(">")  
    print("Echo", command)  
    if command.lower() == "quit":  
        break
```

# Exercise

```
# Display the even number (2 4 6 8) followed by this message "We have 4 even numbers"
```

```
# 2
```

```
# 4
```

```
# 6
```

```
# 8
```

```
# We have 4 even numbers
```

```
count = 0
```

```
for number in range(1, 10):
```

```
    if number % 2 == 0:
```

```
        count = count + 1
```

```
        print(number)
```

```
print(f"we have {count} even number")
```

# Homework

- Write Python code to output the **9\*9 multiplication table** in the format shown below:

```
1*1=1
1*2=2  2*2=4
1*3=3  2*3=6  3*3=9
1*4=4  2*4=8  3*4=12  4*4=16
1*5=5  2*5=10  3*5=15  4*5=20  5*5=25
1*6=6  2*6=12  3*6=18  4*6=24  5*6=30  6*6=36
1*7=7  2*7=14  3*7=21  4*7=28  5*7=35  6*7=42  7*7=49
1*8=8  2*8=16  3*8=24  4*8=32  5*8=40  6*8=48  7*8=56  8*8=64
1*9=9  2*9=18  3*9=27  4*9=36  5*9=45  6*9=54  7*9=63  8*9=72  9*9=81
```
